

GarantieBewaker

USER MANUAL

Register purchases • Monitor warranties • Keep receipts

Jeffrey-Apps | Jeffrey Haimé | October 2026

This guide describes GarantieBewaker version 1.0 on Android phones and tablets. The six original screenshots show the Dutch app interface. Actual labels may vary by language, Android version and device. A recorded warranty expiry date does not independently determine statutory consumer rights.

1. What does GarantieBewaker do?

GarantieBewaker helps you record purchased products and their warranty periods. For each device you can record its name, brand, model, serial number, supplier, purchase date, price, warranty duration, notes and an invoice or receipt.

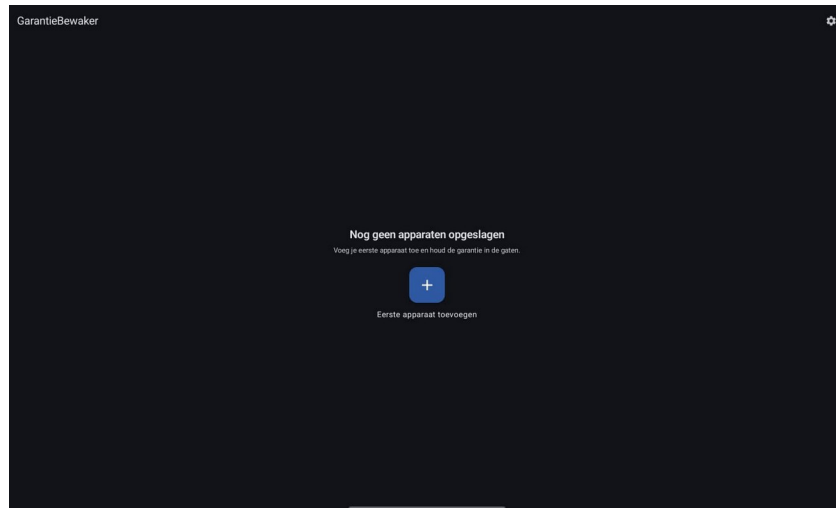

Search and sort the device list and optionally enable reminders one or two months before the recorded warranty expiry date.

According to the version 1.0 information screen, all device data and invoices are stored locally. No account is required; the app has no advertisements, trackers or analytics.

2. The initial home screen

When the list is empty, the screen says that no devices have been saved and offers a blue plus button labelled Add first device.

Open GarantieBewaker, tap the blue plus button and the Add device screen appears. After registering products, the home screen shows device cards. The gear icon in the upper-right corner opens Settings and information.

Original app screenshot (Dutch interface).

3. Add a device

Tap the plus button on the home screen. Enter at least the Device name; the asterisk identifies the required field.

Enter the available brand, model, serial number, store or supplier, purchase date and purchase price. Select a warranty duration and verify the calculated expiry date.

The quick duration buttons are 12, 24, 36, 48 and 60 months. A separate field accepts a warranty duration in months.

Optionally add notes, set reminders, attach a receipt and tap Save device.

Original app screenshot (Dutch interface).

4. Warranty expiry date and reminders

The app shows a Calculated warranty expiry date based on the purchase date and warranty duration. It also offers an Entered warranty expiry date field for manual correction. Use this if the purchase documents specify a different date.

Check both dates against your documents before saving. An entered or calculated date is not a legal determination of warranty rights.

The options Remind one month beforehand and Remind two months beforehand can be switched independently, both while adding a device and on its details screen.

To enable reminders, open the device, turn on the desired switches and save if creating a new record. Use the gear icon to check Android notification permission. Actual delivery depends on Android settings and permissions.

5. Add and view invoices or receipts

The Invoice section offers Take photo, Image and PDF. You can photograph a receipt or select an existing image or PDF file.

Open Add device or edit a saved device, find Invoice, choose one of the three options, follow the Android file or camera prompts, review the details and save.

To view an attachment later, open its device card and tap View invoice. Android asks which compatible app to use, such as Gallery, Photos or a PDF reader.

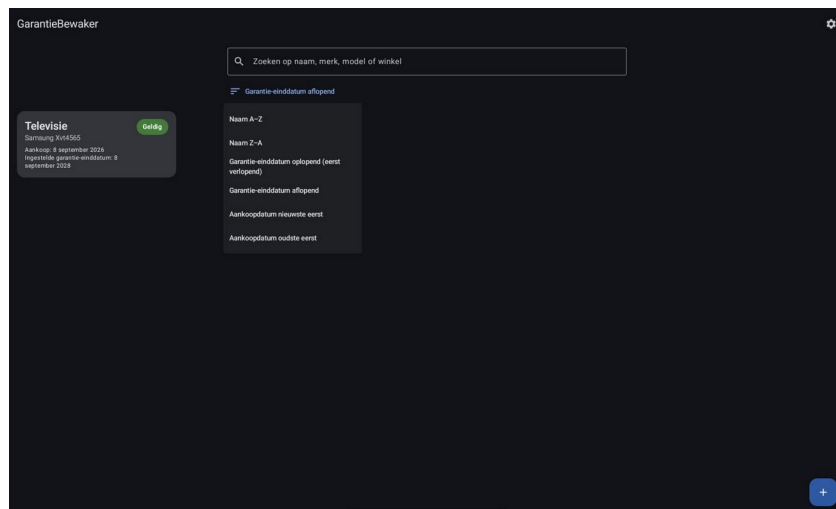

If no attachment exists, the details screen says No invoice saved and View invoice is unavailable.

6. Device list, search and sorting

The search field at the top allows searching by name, brand, model or store. Enter a term to filter the list; clear it to see all entries.

Tap the current sort setting below the search field to open the menu. The original screen shows six sorting options.

Device cards include the name, brand/model, purchase date and entered expiry date. A green Valid status means the recorded expiry date has not yet passed.

Original app screenshot (Dutch interface).

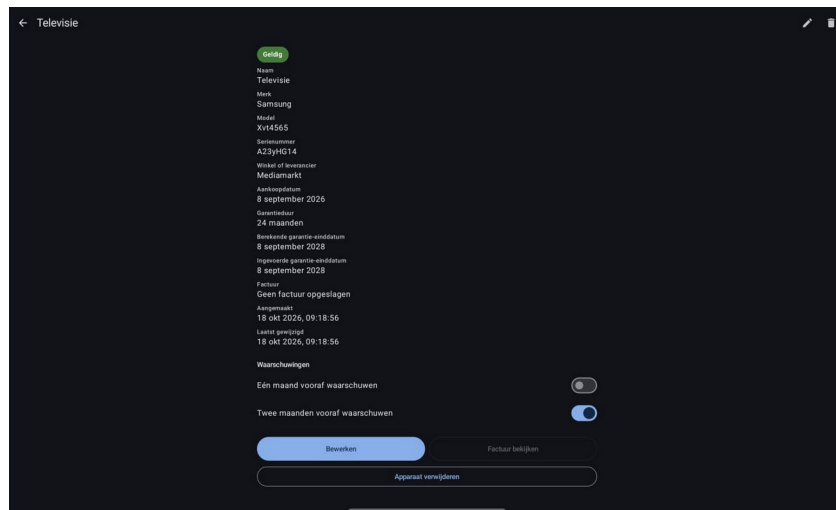

7. View, edit and delete device details

Tap a device card, for example Television, to view its details and warranty status.

Tap Edit or the pencil icon to change details. Tap View invoice when an attachment is present. Tap Delete device or the trash icon to remove the record; carefully review any confirmation.

The details screen also shows the creation date and most recent modification date. Reminder switches can be changed directly here.

Deleting a record may make its locally stored data and receipt inaccessible through the app. Delete only when certain.

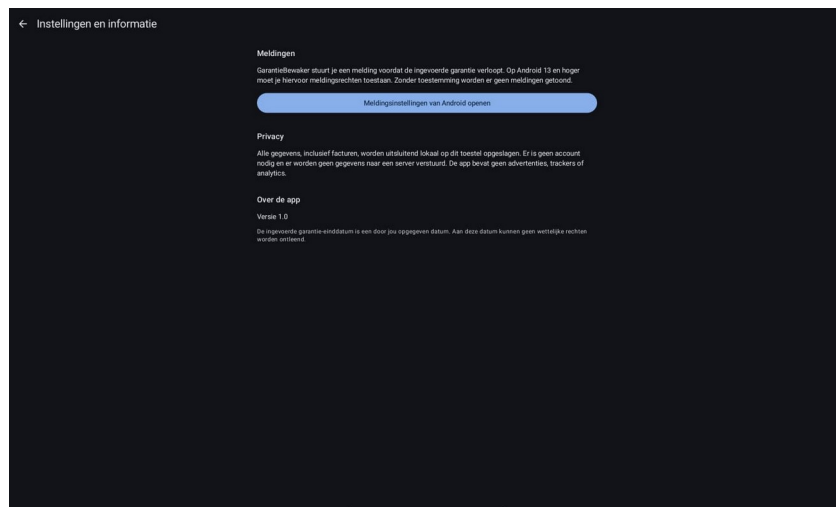

Original app screenshot (Dutch interface).

8. Settings, notifications and privacy

Tap the gear icon at the upper right to open Settings and information.

Tap Open Android notification settings to review the app's notification permission. On Android 13 and later, permission is needed to show notifications. Return using the back arrow.

The Privacy section states that device records and invoices are stored locally and not sent to a server. About the app identifies version 1.0.

Original app screenshot (Dutch interface).

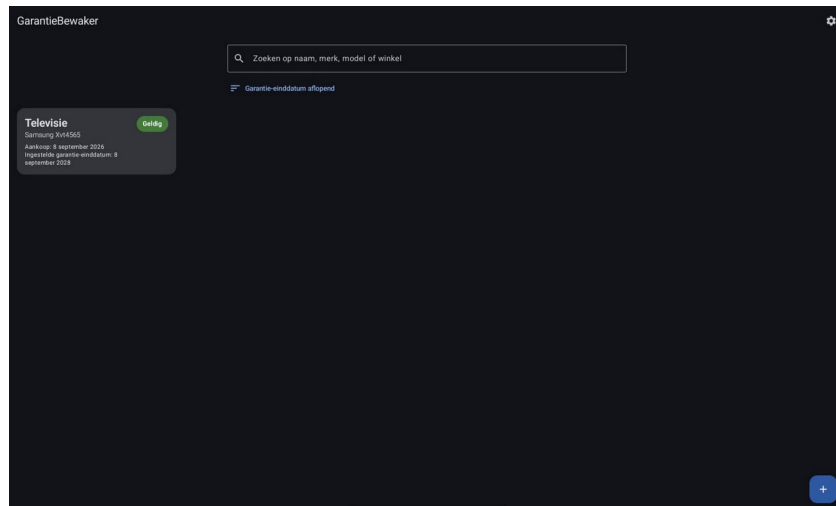

9. Practical example: register a television

Tap plus and enter Television as the name and Samsung as the brand. Optionally enter model, serial number and supplier.

Set the purchase date to 8 September 2026 and the warranty period to 24 months. The calculated expiry date is 8 September 2028.

Verify the entered expiry date, optionally enable the two-month reminder and add a photo or PDF receipt. Tap Save device, then open the saved television card to verify the data.

In the illustrated sample, the one-month reminder is off, the two-month reminder is on, and no invoice is saved.

Original app screenshot (Dutch interface).

10. Frequently asked questions and troubleshooting

No reminder received: check the reminder switch on the device and enable Android notifications through the gear icon. Device power-saving settings may also affect delivery.

Cannot tap View invoice: check whether the details screen says No invoice saved. If so, use Edit to attach a photo, image or PDF.

Android asks which app should open the invoice: this is expected. Select a compatible image viewer or PDF reader.

Incorrect warranty expiry: verify the purchase date and duration and, if necessary, manually correct the entered expiry date. Compare with your receipt and warranty terms.

Device not found: clear the search box and check sorting; search by name, brand, model or store.

App uninstalled or device reset: local records and receipts may be lost. No verified export or restore procedure was shown in the original screenshots. Keep separate copies of important receipts.

11. Checklist and glossary

Before finishing: verify the product name and identifiers; purchase date and duration; calculated and manually entered expiry date; selected reminders; Android notification permission; and attached receipt.

Warranty expiry date: the end date recorded in the app, not a definitive legal assessment. Valid: a status indicating that the recorded end date is in the future.

Notification permission: Android authorization to display app alerts. PDF: a document file format often used for receipts. Locally stored: saved on the device rather than in an online account.

This guide is based on version 1.0 screenshots and confirmed invoice handling. Unseen dialogs and unverified functions are not described as established features. Sample data is illustrative.
